Company Profile

Quantum Mutual Fund (QMF) was launched in December 2005, as India's 29th mutual fund.

With our focus on ethics, integrity and transparency and on managing assets instead of merely gathering them, Quantum Mutual Fund walks a different path as compared to the rest. It could be our total focus on doing what's right for the investor or keeping our costs low, Quantum has chosen to walk the untrodden path, not even the less trodden.

Our Vision:

"To stay focused on the needs of our investors and be India's most respected mutual fund house by adhering to traditional values of simplicity, transparency and integrity while continuing to deliver steady performance over the long term."

The keyword to take away from this statement is the word respected. Not the largest in terms of AuM but the most respected, by doing what's right for the investor and not deviating from our core investment philosophy.

Quantum Mutual Fund has always firmly adhered to its values and will continue to stay true to our philosophy on investments.

About Quantum Mutual Fund

We are focused on the needs of our investors and wish to remain India's most respected Mutual Fund house, adhering to traditional values of simplicity, transparency and integrity.

At Quantum Mutual Fund, our aim is to work for investors. Being the first and only Fund house to approach investors via the Direct route, we phased into Regular Plans in April 2017 after SEBI's ruling on disclosure of commissions. There is no change in Quantum's philosophy. Ever since its inception, Quantum has always maintained transparency in its approach in dealing with investors and our Distributor Partners/IFAs.

Simple Products

Quantum Mutual Fund offers only 9 simple products across the asset classes of Equity, Debt and Gold; that are aimed to match investors' investment objectives.

Sr. No.	Name of the Scheme	Date of Allotment
1	Quantum Long Term Equity Value Fund	March 13, 2006
2	Quantum Liquid Fund	April 07, 2006
3	Quantum Gold Fund - Exchange Traded Fund	February 22, 2008
4	Quantum Nifty ETF - Exchange Traded Fund	July 10, 2008
5	Quantum Tax Saving Fund	December 23, 2008
6	Quantum Equity Fund of Funds	July 20, 2009
7	Quantum Gold Savings Fund	May 19, 2011
8	Quantum Multi Asset Fund	July 11, 2012
9	Quantum Dynamic Bond Fund	May 19, 2015

Our approach towards investments and investors

1. No Star Fund Manager:

Here our investments are not dependent on a single fund manager, but an entire team decides the fate / future of the fund. A research driven approach helps us to take advantage of the long-term investment opportunities that exist across various asset classes – while balancing the inherent risks of investing in an evolving market.

2. Low Cost:

In Mutual Funds, costly funds are those with higher expense ratios, low cost funds have lower expense ratios. Therefore to have a mutual fund with higher expense ratio will make less sense, because a large share of investor's hard earned money that he / she has parked to earn maximum returns, is consumed by the AMCs as a part of their fees. The expense incurred by the AMC / fund house determines the amount that gets invested. A low-cost mutual fund scheme charges low Total Expense Ratio (TER) for investing in their fund. Quantum Mutual Fund abides by its stand of remaining a low-cost mutual fund.

3. No Mis-selling, under any circumstances:

Mis-selling of products is one of the most common problems faced by the investors today. Mutual Funds are nothing but a pool of investors hard earned money invested in schemes that aims to grow and bring good returns. While SEBI has taken constructive steps to address this issue with Categorization and Rationalization of Mutual Fund Schemes, AMCs should abide by the ethical practices and prevent misspelling of its products. When it comes to Quantum Mutual Fund, we don't believe in aggressively selling our mutual funds to investors. We believe that our investors should buy our products. It is more important for us to back each Quantum fund with a solid research and investment process rather than pushing our products to our investors. Moreover, it is important to follow these fundamental practices and imbibe these ethics to build India's premier investment management company by offering our clients/investors a disciplined research and investment process to take advantage of the long-term investment opportunities that exist across various asset classes – while balancing the inherent risks of investing in an evolving market. Quantum Mutual Fund will serve its investors with the highest standards of integrity, ethics, and transparency.

QMF Assets under management has grown from INR 56 Crores in December 2006 to INR 1,536 crores at the end of May 2019.

Brief background of our Sponsor:

Quantum Advisors is 50.8% owned by Mr. Ajit Dayal and the Management Team and 49.2% owned by HWIC Asia. HWIC Asia is ultimately promoted and wholly owned by Fairfax Financial Holdings Limited ("FFHL"). FFHL is a financial services holding company which, through its subsidiaries, is engaged in property & casualty insurance and reinsurance and investment management activities. FFHL is listed on the Toronto Stock Exchange and is the ultimate parent entity of the Fairfax group.

Quantum Advisors is currently registered as a Portfolio Manager with SEBI, an Investment Adviser with the SEC, and a Restricted Portfolio Manager with the Canadian Provinces of British Columbia (BCSC), Ontario (OSC), and Quebec (AMF). In addition, Quantum Advisors provides investment advisory services to its affiliate QIEF Management LLC, based in Mauritius.

The Sponsor has been in the business of equity research and investment advisory services and managing portfolio of securities since 1990.

Equity Outlook Atul Kumar- Head - Equity Funds

Month of May was volatile but ended on a good note for Indian equities. S&P BSE Sensex rose 1.88% based on total returns (including dividends). Mid cap and Small cap indices also had a decent run with appreciation of 1.43% and 1.7% respectively. Exit polls predicted a clear majority for BJP led NDA government. Market wished for continuity and positively greeted the news.

In the first 5 months of 2019 so far S&P BSE Sensex has given 10.46% return. S&P BSE Midcap and S&P BSE Smallcap have been trailing behind with -2% and 1.27% increase respectively. Sectors such as banking, capital goods and real estate were among those that gained maximum during the month. Healthcare and metal were shunned by investors.

Reports of price manipulation in the US and consequent regulatory action hurt pharmaceutical stocks. Trade dispute between US and China led to soft outlook for most industrial commodities including metals. Indian currency depreciated 0.19% during the month.

Market Performance at a Glance	
	Market Returns %*
	May 2019

PAST PERFORMANCE MAY OR MAY NOT BE

FII's turned positive on India with net purchase of stocks worth USD 1.4 billion. In 5 months so far, FIIs have been buyers to the tune of USD 11.2 billion. Domestic institutions (DIIs) were buyers of USD 750 million worth of stocks in May. Of this, majority USD 730 million was from MF players and insurers contributed the rest. Till date, DIIs had net outflows of USD 1.6 billion from stocks in 2019.

Month gone by saw an escalation in Sino-US trade disputes and caught the world markets unaware. US imposed higher tariffs on Chinese imports worth USD 200 million. This was after the trade talks between the two countries failed as China reneged on some clauses that it agreed earlier. The response from Chinese side was to increase tariff on USD 70 billion worth US items.

Matters have deteriorated further with Chinese equipment, specially telecom related getting banned by US Government for any domestic use. The measures and counter-measures are likely to slow down global trade and growth. Demand for many commodities including crude could be affected and their prices have taken a knock.

There are signals that US Fed could reduce interest rates further, which had started to go up in last 2 years. Fears of recession due to trade conflict is reason for possible rate cut in US. Euro zone has also increased liquidity pushing interest rates closer to zero or negative. Such movements have impact on emerging markets such as India. Higher interest rates could lead to flight of capital whereas lower rates cause deluge and increase price of most assets.

Among other events, Brexit deal of Prime Minister Theresa May was rejected after multiple events. She has resigned from her post and a new leader is being looked forward to. This has also increased political and financial uncertainty.

Among domestic news, BJP emerged winner after Lok Sabha elections. It bettered its victory margin of 2014 with 303 seats. However, the economy isn't in a good shape. GDP has grown at 5.8% in last quarter of 2019 fiscal, a considerable slowdown. Problem faced by NBFCs which started in September still continues to linger on. There has been a slowdown in private consumption of most items including cars and two wheelers.

Capital expenditure from private sector is also not showing signs of pick up. Government may have to take steps to increase investment in infrastructure and also help the rural sector with handouts which have been facing problems. While the fiscal deficit may go up, these steps could stimulate the slowing economy.

RBI has cut interest rates by 0.25% early June as was expected. One can expect further reduction as GDP momentum has slackened and also inflation remains under control. Monsoons have been delayed by some days. This is crucial for the country as large part of agriculture sowing depends on rains. International crude oil prices have declined from \$75 to \$60, a relief for the country as it depends heavily on imports.

Over the long term, we remain optimistic on Indian equities. India is likely to grow faster than many nations. Economy is dependent on domestic consumption and thus insulated from any global problems. Events like global trade wars have very limited impact on India. Investors can expect good return from equities over a long period in future. However, valuations have run up recently.

Debt Outlook

Pankaj Pathak - Fund Manager - Fixed Income

The monetary policy committee of the RBI voted 6-0 to cut the policy repo rate by 25 bps from 6.00% to 5.75%. They also changed the policy stance from “Neutral” to “Accommodative”; thus keeping the door open for further reduction in the repo rate.

In the post policy press briefing the RBI Governor raised serious concerns about growth outlook though it was not backed by any significant downward revision in their GDP growth forecast. The RBI expects GDP to grow by 7.0% in 2019-20 against the earlier projection of 7.2%. With this forecast the MPC may not need to cut the Repo rate by a large amount to revive growth back up to potential.

The RBI has now already cut the policy rates thrice from 6.5% to 5.75% within four months. Now the focus should be on maintaining surplus liquidity in the banking system so that transmission of these cuts onto lower lending rates happens at faster pace.

The RBI, in past, has preferred Open Market Operations (OMO) and recently introduced long term FX swaps to infuse durable liquidity in the banking system. Although they can continue to use these and long term repos for liquidity infusing, we believe cutting Cash Reserve Ratio (CRR) for banks can have a better impact in terms of transmission. Now with LCR (Liquidity Coverage Ratio) in place along with the SLR (Statutory Liquidity Ratio), the RBI should take a fresh look at the CRR requirements especially for its virtue of having a lasting effect on the system liquidity and banks' financial position.

For the bond markets this was a good policy particularly with the change in stance to accommodative opening up space for further rally in the bond prices (fall in bond yields). Bond markets have already rallied a great deal in last one month with the 10 year government bond yield down from 7.4% in April to near 6.9% now. However, at current levels it still looks attractively valued as more rate cuts get priced in.

Bond funds with longer maturity profile may benefit from the rate cuts though liquid fund returns will likely fall with the cut in Repo Rates and the desire to keep surplus liquidity. Dynamic Bond Funds, which allow the fund manager flexibility to change the portfolio positioning depending on the emerging situation is a better alternative for the investors who wish to allocate to bond funds and can have a holding period of 2-3 years.

Investors with low risk appetite should stick to Liquid Funds to avoid any sharp volatility in their portfolio value. However, while choosing such funds also one should be aware of the credit risk and prefer funds which take low credit and liquidity risks.

The RBI disappointed the markets but was prudent in not announcing any big bang liquidity measures immediately which was seen in the sharp fall in the equity markets. However, they set up a working group to review the existing liquidity framework and they have also assured the market of timely response to the NBFC issue.

We believe the credit crunch in the NBFC space is mainly due to Investors' trust deficit over the financial position and asset quality of some non-bank lenders. Thus mere liquidity infusion may not be able to resolve the issue.

Investors should also note that the credit crisis which began in the bond markets in September 2018 is not over yet and investors should remain cautious and should always choose debt and liquid funds which priorities safety and liquidity over returns in the current times.

Gold Outlook

Chirag Mehta - Senior Fund Manager - Alternative Investments

World View

Gold is rediscovering its “sweet spot” as escalating concerns about the U.S.-China trade standoff, losses in equities and concerns about slowing growth combine to lift the yellow metal from doldrums. The amped up trade tensions helped gold breakout which was earlier stuck between U.S. dollar vigor and looming market uncertainties. With trade ructions escalating to Mexico, it makes it distinctly clear that U.S. can use its supremacy to weaponize trade on a whim. As impact of trade wars impedes economic activity, it could force the Fed to cut rates and pump in liquidity to support the ailing economy. This would undermine the last support for the dollar and act as a catalyst for gold. Gold saw its first monthly gain in May, breaking a streak of three straight months of losses. Gold prices ended the month at \$1,305.5 an ounce, an increase of +1.7%.

The U.S.-China trade war continues to worsen. Trade negotiations seemed to have lost ground and moved farther away from a resolution. As a result, fresh rounds of retaliatory tariffs have everyone concerned on its impact on growth in an already slowing world. New tariffs on Mexico now extend a different dimension of immigration issue as opposed to be an unfair trade issue, exemplifying how U.S. can exploit its supremacy. It looks more likely that the trade wars will be long, messy and expensive for the world.

The U.S. economy is showing some weakness despite predictions of growth. American factory data has been disappointing, sales of new U.S. homes cooled in April from an 11-year high and pending home sales in April unexpectedly dropped, adding to signs the housing market is struggling to regain momentum. There is further risk of deterioration and trade war could only exacerbate the situation. Bloomberg economists Dan Hansen and Tom Orlik said, “If tariffs expand to cover all U.S.-China trade, and markets slump in response, global GDP will take a \$600 billion hit in 2021, the year of peak impact.” This is just a direct impact; the second round order would be significant as the decline in equity market would undermine the wealth effect and thereby a headwind to consumption and investment, compounding the fallout.

Outlook

Gold is proving to be a major beneficiary of the U.S.-China trade war. Escalating trade tensions between the U.S. and China damped the outlook for growth. China’s retaliatory tariffs have fueled bearish sentiment on the global economy. There are growing signals that an economic slowdown is imminent, with the outlook for China’s manufacturing sector deteriorating more than expected. Should the pressures of the trade war hurt U.S. economic growth, it may prompt the Federal Reserve to reduce interest rates thereby undercutting the dollar. Vice Chairman Richard Clarida said “The Federal Reserve is prepared to ease if it sees mounting risks to the expansion”. Trade war could be a significant catalyst for Gold if it leads to Fed easing in the immediate future, as well as higher inflation expectations.

According to a monthly poll of consumers, expected inflation three years ahead dropped to 2.7 percent in April, which is the lowest reading since August 2017. A similar University of Michigan survey measure of expected inflation in five to 10 years also fell in April to a half-century low. However, the aggressive tariffs if maintained for long can change the inflation dynamics significantly. The U.S. is increasingly slipping into an inflationary environment with tariffs driving up prices. The cost of tariffs has fallen entirely on U.S. businesses which will sooner or later be passed on to consumers. The US could soon end up staring at a stagflation environment where growth will continue declining and inflation moving higher. Fed will be biased towards supporting growth and therefore cut rates which will mean that real interest rates will be on a decline. This scenario will be extremely bullish for gold.

The U.S. yield curve has inverted and industrial production has weakened further, China’s economy is slowing dramatically and in Europe even the likes of Germany are stagnating. Our world has clearly moved from global synchronization to a global slowdown. If the Fed takes a u-turn in policy as a response to slowing growth or falling asset prices by beginning to cut rates or adopt further unconventional measures like QE, it will be perceived by the markets that the central banks are caught in a trap and will not be able to normalize monetary policy. This will be a big boost for gold prices. It is important to note the academic discussions at the Fed are in agreement of further unorthodox monetary policy which implies use of more unconventional tools like monetary easing (money printing) and even negative interest rates. This significantly increases the probability of the Fed to move quickly towards lowering rates to the zero bound and other unconventional tools used on first signs of recession in the United States. Such ill-conceived policy making can be another positive trigger for gold.

Central banks have tried to get out of this low-interest-rate trap but they aren’t able to. The market is addicted to cheap liquidity and doesn’t look like that is going to change anytime soon. The world continues to remain in state of great disequilibrium, both with respect to the global economy and geopolitics as well. Given the macroeconomic picture, gold will be a useful portfolio diversification tool and thereby helping you to reduce overall portfolio risk.

Returns are calculated on the basis of Compounded Annualized Growth Rate (CAGR).
Regular plan launched on 1 April 2017 but not yet completed 3 years period since its launch.

SIP Performance

SIP Performance of Quantum Long Term Equity Value Fund as on May 31, 2019 - Direct Plan - Growth Option

	Total Amount Invested (₹'000)	Mkt Value as on May 31, 19 (₹'000)	Returns (XIRR*) (%)	S&P BSE - SENSEX TRI (XIRR*) (%)	NIFTY 50 TRI (XIRR*) (%)
SIP Since Inception	1,580.00	4,171.55	13.77	11.98	11.79
10 Years SIP	1,200.00	2,338.15	12.83	12.48	12.21
7 Years SIP	840.00	1,308.99	12.50	13.66	13.31
5 Years SIP	600.00	765.85	9.75	13.03	12.46
3 Years SIP	360.00	404.98	7.87	15.73	14.36
1 Year SIP	120.00	126.22	10.00	18.64	18.15

Past performance may or may not be sustained in the future. Load is not taken into consideration using applicable NAV on the SIP day (5th of every month). Return on SIP and Benchmark are annualized and compounded investment return for cash flows resulting out of uniform and regular monthly subscriptions as on 5th day of every month (in case 5th is a non-Business Day, then the next Business Day) and have been worked out using the Excel spreadsheet function known as XIRR. XIRR calculates the internal rate of return for series of cash flow. Assuming ₹10,000 invested every month on 5th day of every month (in case 5th is a non-Business Day, then the next Business Day), the 1 year, 3 years, 5 years, 7 years, 10 years and since inception returns from SIP are annualized and compounded investment return computed on the assumption that SIP installments were received across the time periods from the start date of SIP from the end of the relevant period viz. 1 year, 3 years, 5 years, 7 years, 10 years and since Inception. *XIRR - XIRR calculates the internal rate of return to measure and compare the profitability of series of investments.

Exit Load:

Provisions	% of Exit Load
10% of units if redeemed or switched out during exit load period i.e. 730 days from the allotment Exit Load Period : 730 days from the date of allotment	NIL
Remaining 90% of units in parts or full :	
(i) if redeemed or switched out on or before 365 days from the date of allotment	2%
(ii) if redeemed or switched out on or after 365 days but before 730 days from the date of allotment	1%
If units redeemed or switched out after 730 days from the date of allotment	NIL

Note: Redemptions / Switch outs of units will be done on First In First Out (FIFO) basis. The above mentioned Exit Load shall be equally applicable to the special products such as Systematic Withdrawal Plan (SWP)/Systematic Transfer Plan (STP) and Switches etc. However, there is no load shall be charged for switching in between option / plan within the scheme.

Product Labeling

Name of the Scheme	This product is suitable for investors who are seeking*	Riskometer
Quantum Long Term Equity Value Fund (An Open Ended Equity Scheme following a Value Investment Strategy)	<ul style="list-style-type: none"> Long term capital appreciation Invests primarily in equity and equity related securities of companies in S&P BSE 200 index. 	 <p>Investors understand that their principal will be at Moderately High Risk</p>

*Investors should consult their financial advisers if in doubt about whether the product is suitable for them.

^^ Note:

Risk Free Rate assumed to be 6.00% (FBIL Overnight MIBOR for 31st May 2019) for calculating Sharpe Ratio. Standard Deviation, Sharpe Ratio & Beta are calculated on Annualised basis using 3 years history of monthly returns.

Definitions

Standard deviation measures historical volatility. A high standard deviation suggests high volatility, while lower standard deviation would refer to more stability.

Beta is the tendency of a fund's returns to respond to market swings. A beta of 1 indicates that the fund price will move with the market. A beta of less than 1 means that the security will be less volatile than the market. A beta of greater than 1 indicates that the security's price will be more volatile than the market.

Sharpe Ratio is used to characterise how well the return of an asset compensates the investor for the risk taken. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance has been.

Portfolio Turnover Ratio is the percentage of a funds assets that have changed over the course of a year.

QUANTUM TAX SAVING FUND

An Open Ended Equity Linked Saving Scheme with a Statutory Lock in of 3 years and Tax Benefit

Investment Objective : The investment objective of the Scheme is to achieve long-term capital appreciation by investing primarily in shares of companies that will typically be included in the S&P BSE 200 Index and are in a position to benefit from the anticipated growth and development of the Indian economy and its markets.

May 2019

SIP Performance

Quantum Tax Saving Fund as on May 31, 2019 - Direct Plan - Growth Option

	Total Amount Invested (₹'000)	Mkt Value as on May 31, 19 (₹'000)	Returns (XIRR*) (%)	S&P BSE - SENSEX TRI (XIRR*) (%)	NIFTY 50 TRI (XIRR*) (%)
SIP Since Inception	1,210.00	2,610.74	13.53	12.95	12.34
10 Years SIP	1,200.00	2,333.05	12.79	12.48	12.21
7 Years SIP	840.00	1,311.14	12.54	13.66	13.31
5 Years SIP	600.00	766.91	9.80	13.03	12.46
3 Years SIP	360.00	405.38	7.94	15.73	14.36
1 Year SIP	120.00	126.24	10.04	18.64	18.15

Past performance may or may not be sustained in the future. Scheme performance has been calculated using applicable NAV on the SIP day (5th of every month). Return on SIP and Benchmark are annualized and compounded investment return for cash flows resulting out of uniform and regular monthly subscriptions as on 5th day of every month (in case 5th is a non-Business Day, then the next Business Day) and have been worked out using the Excel spreadsheet function known as XIRR. XIRR calculates the internal rate of return for series of cash flow. Assuming ₹10,000 invested every month on 5th day of every month (in case 5th is a non-Business Day, then the next Business Day), the 1 year, 3 years, 5 years, 7 years, 10 years, and since inception returns from SIP are annualized and compounded investment return computed on the assumption that SIP installments were received across the time periods from the start date of SIP from the end of the relevant period viz. 1 year, 3 years, 5 years, 7 years, 10 years and since Inception. *XIRR - XIRR calculates the internal rate of return to measure and compare the profitability of series of investments.

The Schemes which are selected for investments in QEFOF based on QIS / PFN Research.

TRANSACTION CHARGES: No Transaction Charges shall be deducted from the investment amount for applications received in the Regular Plan.

^^ Note:

Risk Free Rate assumed to be 6.00% (FBIL Overnight MIBOR for 31st May 2019) for calculating Sharpe Ratio.

Standard Deviation, Sharpe Ratio & Beta are calculated on Annualised basis using 3 years history of monthly returns.

Definitions

Standard deviation measures historical volatility. A high standard deviation suggests high volatility, while lower standard deviation would refer to more stability.

Beta is the tendency of a fund's returns to respond to market swings. A beta of 1 indicates that the fund price will move with the market. A beta of less than 1 means that the security will be less volatile than the market. A beta of greater than 1 indicates that the security's price will be more volatile than the market.

Sharpe Ratio is used to characterise how well the return of an asset compensates the investor for the risk taken. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance has been.

QUANTUM DYNAMIC BOND FUND

An Open Ended Dynamic Debt Scheme Investing Across Duration

Investment Objective : To generate income and capital appreciation through active management of portfolio consisting of short term, long term debt and money market instruments.

Scheme Features

Fund Manager

Mr. Pankaj Pathak

Regular plan launched on 1 April 2017 but not yet completed 3 years period since its launch.

SIP Performance

SIP Performance of Quantum Gold Savings Funds as on May 31, 2019 - Direct Plan

	Total Amount Invested (₹'000)	Mkt Value as on May 31, 19 (₹'000)	Returns (XIRR*) (%)	Domestic Price of Gold (XIRR*)
SIP Since Inception	960.00	1,020.57	1.52	2.69
7 Years SIP	840.00	888.34	1.58	2.76
5 Years SIP	600.00	648.04	3.06	3.99
3 Years SIP	360.00	375.92	2.86	3.59
1 Year SIP	120.00	122.41	3.83	4.59

Past performance may or may not be sustained in the future. Return on SIP and Benchmark are annualized and compounded investment return for cash flows resulting out of uniform and regular monthly subscriptions as on 5th day of every month (in case 5th is a non-Business Day, then the next Business Day) and have been worked out using the Excel spreadsheet function known as XIRR. XIRR calculates the internal rate of return for series of cash flow. Assuming ₹10,000 invested every month on 5th day of every month (in case 5th is a non-Business Day, then the next Business Day), the 1 year, 3 years, 5 years, 7 years and since inception returns from SIP are annualized and compounded investment return computed on the assumption that SIP installments were received across the time periods from the start date of SIP from the end of the relevant period viz. 1 year, 3 years, 5 years, 7 years and since Inception. *XIRR - XIRR calculates the internal rate of return to measure and compare the profitability of series of investments.

QUANTUM MULTI ASSET FUND

An Open Ended Fund of Funds Scheme Investing in schemes of Quantum Mutual Fund

Investment Objective : The investment objective of the Scheme is to generate modest capital appreciation while trying to reduce risk (by diversifying risks across asset classes) from a combined portfolio of equity, debt / money markets and Gold schemes of Quantum Mutual Fund. The Scheme may invest in the units of debt / money market schemes of other mutual funds to gain exposure to debt as an asset class to manage any investment and regulatory constraints that arise/ that prevent the Scheme from increasing investments in the schemes of Quantum Mutual Fund. There can be no assurance that the investment objective of the Scheme will be realized.

*Cash & Cash Equivalents

^^ Note:

Risk Free Rate assumed to be 6.00% (FBIL Overnight MIBOR for 31st May 2019) for calculating Sharpe Ratio.

Standard Deviation, Sharpe Ratio & Beta are calculated on Annualised basis using 3 years history of monthly returns.

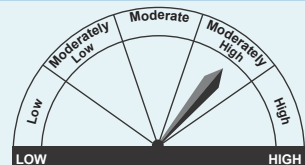

Definitions

Standard deviation measures historical volatility. A high standard deviation suggests high volatility, while lower standard deviation would refer to more stability.

Beta is the tendency of a fund's returns to respond to market swings. A beta of 1 indicates that the fund price will move with the market. A beta of less than 1 means that thesecurity will be less volatile than the market. A beta of greater than 1 indicates that the security's price will be more volatile than the market.

Sharpe Ratio is used to characterise how well the return of an asset compensates the investor for the risk taken. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance has been.

QUANTUM GOLD FUND

An Open Ended Scheme Replicating / Tracking Gold

Investment Objective: The Investment Objective of the Scheme is to generate returns that are in line with the performance of gold and gold related instruments subject to tracking errors. However, investment in gold related instruments will be made if and when SEBI permits mutual funds to invest, in gold related instruments. The Scheme is designed to provide returns that before expenses, closely correspond to the returns provided by gold.

^^ Note:

Tracking Error is calculated on Annualised basis using 3 years history of daily returns.

Definitions

Tracking Error is a measure of how closely a fund follows the index to which it is benchmarked. The more passively the fund is managed, the smaller the tracking error. In the case of Exchange Traded Funds, the lower the Tracking Error, the better.

***Portfolio Turnover Ratio** is the percentage of a funds assets that have changed over the course of a year.

QUANTUM NIFTY ETF

An Open Ended Scheme Replicating / Tracking Nifty 50 Index

Investment Objective : The investment objective of the scheme is to invest in stocks of companies comprising Nifty 50 Index and endeavour to achieve return equivalent to Nifty by "Passive" investment. The Scheme will be managed by replicating the index in the same weightage as in the Nifty 50 Index with the intention of minimizing the performance differences between the scheme and the Nifty 50 Index in capital terms, subject to market liquidity, costs of trading, managing expenses and other factors which may cause tracking error.

^^ Note: Tracking Error is calculated on Annualised basis using 3 years history of daily returns.

Definitions

Tracking Error is a measure of how closely a fund follows the index to which it is benchmarked. The more passively the fund is managed, the smaller the tracking error. In the case of Exchange Traded Funds, the lower the Tracking Error, the better.

Portfolio Turnover Ratio is the percentage of a funds assets that have changed over the course of a year.

INVESTMENT OBJECTIVE	The investment objective of the scheme is to generate long-term capital appreciation by investing in a portfolio of open-ended diversified equity schemes of mutual funds registered with SEBI. There can be no assurance of positive returns from following the stated investment strategy.	The investment objective of the Scheme is to provide capital appreciation by predominantly investing in units of Quantum Gold Fund Replicating / Tracking Gold – an Exchange Traded Fund The performance of the Scheme may differ from that of Quantum Gold Fund and the domestic prices of gold due to expenses and certain other factors. There can be no assurance or guarantee that the investment objective of the Scheme will be achieved.	The investment objective of the Scheme is to generate modest capital appreciation while trying to reduce risk (by diversifying risks across asset classes) from a combined portfolio of equity, debt / money markets and Gold schemes of Quantum Mutual Fund. The Scheme may invest in the units of debt / money market schemes of other mutual funds to gain exposure to debt as an asset class to manage any investment and regulatory constraints that arise / that prevent the Scheme from increasing investments in the schemes of Quantum Mutual Fund. There can be no assurance that the investment objective of the Scheme will be realized.

DETAILS	QUANTUM DYNAMIC BOND FUND	QUANTUM GOLD FUND	QUANTUM NIFTY ETF																																				
TYPE OF SCHEME	An Open Ended Dynamic Debt Scheme Investing Across Duration	An Open Ended Scheme Replicating / Tracking Gold	An Open Ended Scheme Replicating / Tracking Nifty 50 Index																																				
THIS PRODUCT IS SUITABLE FOR INVESTORS WHO ARE SEEKING*	<ul style="list-style-type: none"> Regular income over short to medium term and capital appreciation Investment in Debt / Money Market Instruments / Government Securities. 	<ul style="list-style-type: none"> Long term returns Investments in physical gold. 	<ul style="list-style-type: none"> Long term capital appreciation Investments in equity and equity related securities of companies in Nifty 50 Index. 																																				
Riskometer	 <p>Investors understand that their principal will be at Moderate Risk</p>	 <p>Investors understand that their principal will be at Moderately High Risk</p>	 <p>Investors understand that their principal will be at Moderately High Risk</p>																																				
INVESTMENT OBJECTIVE	The investment objective of the scheme is to generate income and capital appreciation through active management of a portfolio consisting of short term and long term debt and money market instruments.	The Investment Objective of the Scheme is to generate returns that are in line with the performance of gold and gold related instruments subject to tracking errors. However, investments in gold related instruments will be made if and when SEBI permits mutual funds to invest, in gold related instruments. The Scheme is designed to provide returns that before expenses, closely correspond to the returns provided by gold.	The investment objective of the scheme is to invest in stocks of companies comprising Nifty 50 Index and endeavour to achieve returns equivalent to the Nifty by "passive" investment. The scheme will be managed by replicating the index in the same weightage as in the Nifty 50 Index with the intention of minimizing the performance differences between the scheme and the Nifty 50 Index in capital terms, subject to market liquidity, costs of trading, management expenses and other factors which may cause tracking error.

Understanding Risk in your Investments

Updated on 15-05-2019

All investing involves an element of risk. In a mutual fund investors trust their money to the fund manager whose team in turn invests it in securities linked to the financial market - equities, debt, and gold depending on the fund's nature. And the market values of these keep moving which makes the returns from mutual funds subject to risk.

Risk overview

The risk in mutual funds investment mainly refers to the possibility of returns being different from what was originally expected. In other words risk indicates volatility of returns. Generally higher the return higher would be the risk associated with the investment. This relationship of risk and return is central to investing, which all investors should be aware of.

Fundamentally it works this way because investors who take on higher risk need to be compensated with higher returns. Thus although 'risk' commonly rings a negative connotation for investors, who believe it is to be avoided as much as possible, it is not necessarily an evil. By understanding and managing it investors can use it to their advantage in meeting their investment goals.

Understanding your risk appetite to choose investments

To be able to choose the right funds an investor needs to be aware of his/her risk appetite. Risk appetite refers to the ability and willingness of a person to tolerate loss of their investment. Individual risk tolerance is a very subjective matter and depends on one's financial situation as well as psychological characteristics. For an overall review of your financial situation kindly take the Financial Health Check Up questionnaire.

An aggressive investor is prepared to take higher risk in anticipation of higher returns whereas a conservative investor would be content with low returns in return of lower risk. Therefore the products a person aged 50 years uses for building retirement corpus may be very different from what a person aged 35 years may choose for the same goal.

Generally speaking, amongst the securities that mutual funds' portfolio are built of, the spectrum of risk would have cash and money market securities having the lowest risk at the left end, bonds and other debt securities in the middle and gold, equities at the right having the highest risk.

Aligning investments with your risk appetite is important for success. For an assessment of your risk profile and suggested investment portfolio kindly visit the Asset Allocation calculator.

Measures of risk in mutual funds

It's important to understand the level of risk linked to an investment product while planning to employ it. Two funds giving similar returns may not be equally attractive as one can be significantly risky than the other. For you to be able to choose funds suiting your risk profile we have classified schemes of Quantum Mutual Fund based on their riskiness below. However first we present the basic risk measures commonly used to evaluate mutual funds – alpha, beta, r-squared and standard deviation.

Beta

Beta measures a fund's volatility in comparison with the market. The volatility of the market is 1 by convention. For mutual funds their benchmark is taken to be the market.

A beta greater than 1 says the fund is more volatile than the market whereas beta less than 1 indicates it is less volatile than the market. For instance if a fund has beta 1.1 then it is 10% more volatile than its benchmark. This means when the benchmark's return is 20% the fund's return would be 22%.

Higher beta thus means higher risk. Conservative investors would seek funds with low beta levels.

Alpha

Alpha measures a fund's outperformance with respect to its benchmark. Technically it indicates a fund's performance as measured by the difference in actual returns and the returns one would have expected based on its beta risk. So a positive alpha indicates a fund's outperformance compared to what was expected based on its beta and a negative alpha tells a fund has underperformed than what its beta predicted.

In essence alpha represents the value a fund manager adds to the fund by managing its portfolio, over and above the market's returns. Alpha returns come from the fund manager's ability to pick the right securities and also time the entry and exit in those securities well.

Higher the alpha the better it is for investors. However for index funds, whose portfolios are supposed to be replicas of their benchmarks, alpha is not a relevant risk tool.

R-squared

R-squared tells how similar a fund's performance is to its benchmark's; or put differently how much of the performance comes solely from movements in its benchmark. R-squared values range from 0 to 1 and are commonly stated as percentages from 0 to 100%. An R-squared of 100% means all movements of a security are completely explained by movements in the index.

Actively managed funds would be expected to have low R2 since their portfolio would not be identical to their benchmark index and hence their performance would be quite different from the benchmark's.

To correctly measure a fund's risk-return in terms of alpha, beta it is important that the selected benchmark has high R2.

Standard deviation (SD)

This measure is used perhaps more than others in gauging a fund's risk. Standard deviation of a fund, expressed as a percentage, defines how much a fund's return has varied from its average return. If a fund has higher standard deviation its returns (as calculated from NAV) is expected to be so much more volatile. In short standard deviation of a fund represents the consistency of its performance.

Getting a little deeper into the properties of standard deviation, in most cases the fund's future returns would fall within one SD 68% of the time, within two SDs 95% and within three SDs 99% of the time. What this means is if a fund has standard deviation of 5 and its average annual return has been 15% then one can expect its returns to lie between 10% and 20% most of the time (or to be accurate 68% of the time) and can expect them to be between 5% and 25% almost all of the time (95% of the time). Standard deviation of a fund should be studied in comparison with its peer funds - funds of a category having similar portfolio construction.

Risk levels of Quantum's funds

Here is a graphical comparison of Quantum's schemes based on the high risk-high return, low risk-low return principle.

Illustrative view

Disclaimer: The above chart is for illustration purpose only

May 2019

The various BSE and NSE Indices are compiled on factors such as market cap, trading volume, and a broad sector representation. In doing so, the quality of the management - while admittedly a qualitative judgement - is not considered. This, in our view, represents "risk". For the increased "risk" taken, financial theory suggests that investors should get higher returns. By adding an integrity screen to our investment process, the Quantum Long Term Equity Value Fund (QLTEVF) and the Quantum Tax Saving Fund (QTSF) are attempting to reduce such "risks" - and therefore might generate lower returns. To peruse the performance of our schemes please see below. Past Performance may or may not be sustained in the future.

Quantum Liquid Fund which invests primarily in money market securities is expected to be in the low risk category among all funds. Quantum Dynamic Bond Fund invests in debt securities and therefore follows the liquid fund on this chart. Following it are Quantum Gold Savings Fund whose portfolio is mostly composed of units of Quantum Gold Fund (ETF) along with a small exposure to liquid securities, and Quantum Gold Fund (ETF) investing in gold bullion.

Quantum Multi Asset Fund comes next; its portfolio has exposure to equities, debt and gold.

Farther along the risk chart are the equity funds. Quantum Tax Saving Fund and Quantum Long Term Equity Value Fund are expected to have greater risk than the non-equity funds. Quantum Equity Fund of Funds which invests in a basket of select equity mutual funds features next. Quantum Nifty ETF (QNifty) at the farthest is expected to be in the high risk category among all funds as it replicates the index Nifty 50 in composition and has no active management by fund managers.

In reality however the riskiness of funds – as known from their actual performance studied over periods – may vary from the illustrative chart based on various factors that affect performance such as state of the national economy, climate in global financial markets, exchange rate scenario, etc.

Graph based on Daily NAV data from date of inception of respective Schemes till 31st May 2019

Disclaimer: Past Performance may or may not be sustained in the future.

1. This graph attempts to shows the actual ‘Risk’ of investing in each Schemes of Quantum Mutual Fund. Standard Deviation is measured on the X-Axis and Returns are on the Y axis being actual CAGR Returns arrived from since Inception data.
2. Standard Deviation is calculated since Inception of the scheme till 31st May 2019. Please refer to the table below for the Inception dates of the respective Schemes.
3. Standard Deviation is calculated on daily Returns of respective Schemes, which is arrived from the daily declared NAV’s and then annualized.

Quantum Nifty ETF	Page 39

List from lowest standard deviation to highest standard deviation

Name of Fund	Date of Inception	Risk (Standard Deviation) (%)	Return (%)
Quantum Liquid Fund (QLF)	7-Apr-06	0.23%	7.46%
Quantum Dynamic Bond Fund (QDBF)	19-May-15	3.10%	8.85%
Quantum Multi Asset Fund (QMAF)	11-Jul-12	4.74%	9.37%
Quantum Gold Savings Fund (QGSF)	19-May-11	12.72%	3.48%
Quantum Equity Fund of Funds (QEFOF)	20-Jul-09	14.02%	13.89%
Quantum Tax Saving Fund (QTSF)	23-Dec-08	14.12%	17.92%
Quantum Long Term Equity Value Fund (QLTEVF)	13-Mar-06	17.33%	13.97%
Quantum Gold Fund (QGF)	22-Feb-08	17.81%	8.00%
Quantum Nifty ETF (QNIFTY)	10-Jul-08	20.34%	11.46%

HOW TO READ THE FACTSHEET

Fund Manager: An employee of the asset management company such as a mutual fund or life insurer, who manages investments of the scheme. He is usually part of a larger team of fund managers and research analysts.

Application Amount for Fresh Subscription: This is the minimum investment amount for a new investor in a mutual fund scheme.

Minimum Additional Amount: This is the minimum investment amount for an existing investor in a mutual fund scheme.

Yield to Maturity: The Yield to Maturity or the YTM is the rate of return anticipated on a bond if held until maturity. YTM is expressed as an annual rate. The YTM factors in the bond's current market price, par value, coupon interest rate and time to maturity.

SIP: SIP or systematic investment plan works on the principle of making periodic investments of a fixed sum. It works similar to a recurring bank deposit. For instance, an investor may opt for an SIP that invests ₹ 500 every 15th of the month in an equity fund for a period of three years.

NAV: The NAV or the net asset value is the total asset value per unit of the mutual fund after deducting all related and permissible expenses. The NAV is calculated at the end of every business day. It is the value at which the investor enters or exits the mutual fund.

Benchmark: A group of securities, usually a market index, whose performance is used as a standard or benchmark to measure investment performance of mutual funds, among other investments. Some typical benchmarks include the Nifty, Sensex, BSE200, BSE500, 10-Year Gsec.

Entry Load: A mutual fund may have a sales charge or load at the time of entry and/or exit to compensate the distributor/agent.

Entry load is charged at the time an investor purchases the units of a mutual fund. The entry load is added to the prevailing NAV at the time of investment. For instance, if the NAV is ₹ 100 and the entry load is 1%, the investor will enter the fund at Rs 101.

Note: SEBI, vide circular dated June 30, 2009 has abolished entry load and mandated that the upfront commission to distributors will be paid by the investor directly to the distributor, based on his assessment of various factors including the service rendered by the distributor

Exit Load: Exit load is charged at the time an investor redeems the units of a mutual fund. The exit load is deducted from the prevailing NAV at the time of redemption. For instance, if the NAV is ₹ 100 and the exit load is 1%, the redemption price would be Rs 99 Per Unit.

Modified Duration: Modified duration is the price sensitivity and the percentage change in price for a unit change in yield

Standard Deviation: Standard deviation is a statistical measure of the range of an investment's performance. When a mutual fund has a high standard deviation, it means its range of performance is wide, implying greater volatility.

Sharpe Ratio: The Sharpe Ratio, named after its founder, the Nobel Laureate William Sharpe, is a measure of risk-adjusted returns. It is calculated using standard deviation and excess return to determine reward per unit of risk.

Beta: Beta is a measure of an investment's volatility vis-à-vis the market. Beta of less than 1 means that the security will be less volatile than the market. A beta of greater than 1 implies that the security's price will be more volatile than the market.

AUM: AUM or assets under management refers to the recent / updated cumulative market value of investments managed by a mutual fund or any investment firm.

Holdings: The holdings or the portfolio is a mutual fund's latest or updated reported statement of investments/securities. These are usually displayed in terms of percentage to net assets or the rupee value or both. The objective is to give investors an idea of where their money is being invested by the fund manager.

Nature of Scheme: The investment objective and underlying investments determine the nature of the mutual fund scheme. For instance, a mutual fund that aims at generating capital appreciation by investing in stock markets is an equity fund or growth fund. Likewise, a mutual fund that aims at capital preservation by investing in debt markets is a debt fund or income fund. Each of these categories may have sub-categories.

Rating Profile: Mutual funds invest in securities after evaluating their creditworthiness as disclosed by the ratings. A depiction of the mutual fund in various investments based on their ratings becomes the rating profile of the fund. Typically, this is a feature of debt funds.

STATUTORY DETAILS & RISK FACTORS

Disclaimer, Statutory Details & Risk Factors:

Mutual fund investments are subject to market risks read all scheme related documents carefully.

Please visit – www.Quantummf.com to read scheme specific risk factors.
